

VIRUSOLOGIA DEMO REPORT

Evidence-first assisted pentest sample deliverable

This public sample shows the structure expected from a commercial Virusologia assessment: executive decision summary, validated evidence, remediation ownership, SLA and retest criteria. The content is intentionally redacted and uses a demo target.

Security score	Validated findings	Evidence quality	Recommended SLA
7.4 / 10	3	92%	14 days

Executive Decision Summary

The demo target shows medium business risk. Public exposure is limited, but session boundary, intake discipline and evidence packaging require remediation before a production-grade security workflow is credible.

Validated Findings

ID	Finding	Severity	Retest criterion
DEMO-API-001	Authenticated API coverage gap	Medium	Two owned identities produce a complete read-only role matrix.
DEMO-EDGE-002	Legacy route canonical drift	Low	Legacy paths return stable 301 to canonical routes.
DEMO-FUNNEL-003	Unstructured intake	Medium	Assessment requests generate a stored request ID with authorization confirmed.

Remediation Roadmap

Priority	Owner	Action
P0	Engineering	Normalize canonical host, legacy redirects, robots and sitemap.
P0	Product	Use structured authorized-scope intake for commercial requests.
P1	Security	Promote signed evidence bundles after production credentials are ready.

Generated as a public redacted sample. No client secrets, cookies, raw tokens or private evidence are included.
